

The main goal of this project is to revolutionize hygiene standards in shared environments by introducing a highly effective and portable solution for footwear disinfection. Our aim is to provide a comprehensive defense against the transmission of pathogens carried on footwear, thereby reducing the risk of contamination in critical settings such as healthcare facilities, food processing plants, agricultural and industrial sites as well as public toilet facilities in the Ghanaian settings. By developing the footwear sanitization kit, we seek to promote a safer and healthier environment for both workers and visitors, which will ultimately contribute to improved public health outcomes and enhanced cleanliness standards across various industries.
